Project: The Autonomous Edge Engineer

Objective: Build a self-healing, autonomous Cloudflare Worker that uses Claude 3.5 Sonnet to monitor its own performance and deploy its own patches via GitHub.

1. Core Stack

- **Compute:** Cloudflare Workers (using the Agent SDK).
- **State:** Durable Objects (to keep the agent "alive" between sessions).
- **Intelligence:** Anthropic Claude 3.5 Sonnet (via Cloudflare AI Gateway).
- **Deployment:** GitHub Actions + Wrangler.

2. The "OpenClaw" Style Workflow

To mimic the OpenClaw "Heartbeat" loop:

- Create a `HEARTBEAT` function in your Worker using `env.Service.schedule`.
- Every 30 minutes, the Worker calls Claude: "Here is my current code and my latest Sentry/Log error rates. Do I need to optimize anything?"
- If Claude suggests a change, the Worker opens a **Pull Request** on GitHub via the GitHub API.

3. Implementation Steps

Step A: Fix Cline (Direct Access)

- **Provider:** Anthropic
- **API Key:** [Your Key]
- **Base URL:** [LEAVE EMPTY]
- **Model:** `claude-3-5-sonnet-latest`

Step B: Scaffold the Agent Worker

Run this in your terminal:

```
npm create cloudflare@latest -- --template cloudflare/agents-starter
```

Step C: The "Impressive" Feature

Implement a **D1 Database** binding. Have the agent store its "Learnings" (e.g., "I found that using Hono framework reduced my cold start by 10ms") in a SQL database. When the hiring manager visits your project URL, show them a "Brain Log" of how the agent has been iterating on itself.

4. Why this beats Kasm/Cloud IDE

- **Zero Latency:** You code locally in VS Code/Cline.
- **Production Ready:** You aren't just "chatting" with code; you're building a distributed system.
- **Cost Effective:** You only pay for the execution time, not a running cloud server.
