The "Power User" Setup: Claude Code + Cursor + Cloudflare

This workflow assumes you are building on your laptop. It eliminates the need for Kasm while giving you massive iterative power.

1. The Terminal Setup (Claude Code)

Install Claude Code directly on your machine. This will be your "Autonomous Command Center" inside the Cursor terminal.

```
npm install -g @anthropic-ai/claude-code
# Then navigate to your project folder and start it
claude
```

Why inside Cursor? When Claude Code makes a change to a file, Cursor will instantly highlight the diff in the editor. You can visually review the code in Cursor while Claude Code continues to run tests or deploy via `wrangler` in the background.

2. The Cloudflare "Agentic" Intelligence

To impress a hiring manager, don't just build a Worker—build a **Stateful Agent**.

- **Cloudflare Agents SDK:** Use this to create "Durable Object" agents. These are Workers that have their own private SQLite database and "memory."
- **MCP (Model Context Protocol):** Connect Claude Code to the **Cloudflare MCP**. This allows Claude Code to actually "see" your Cloudflare account (list workers, check D1 databases, read R2 buckets) directly from the prompt.

3. The "Hiring Manager" Workflow

Follow this loop to build your project:

1. **Architecture (Cursor Composer):** Use `Cmd+I` in Cursor to say: *"Scaffold a Cloudflare Worker using the Agents SDK that connects to a D1 database."*
2. **Logic & Refinement (Claude Code):** In the terminal, run `claude`. Say: *"Look at my `wrangler.toml` and the Worker logic. Implement the authentication flow and ensure the D1 migrations are handled."*
3. **Deployment & Debugging (Claude Code):** Say: *"Run `wrangler deploy`. If it fails, read the error log and fix the configuration."*

4. **The "Wow" Factor (Agent Memory):** Implement the **Cloudflare Agent Memory** feature. This allows your deployed worker to "remember" previous user interactions across sessions.

4. Key Pro-Tips

- **Fixing the 404:** Since you are using Claude Code, it uses the official Anthropic auth flow (not the VS Code extension's buggy settings). This usually bypasses the 404 errors you saw in Cline.
- **The "CLAUDE.md" File:** Create a `CLAUDE.md` file in your root directory. Put your project's coding standards and Cloudflare environment variables there. Claude Code reads this file first, so it won't keep asking you for context.
